

An engineer's guide to Linux Kernel upgrades

Ignat Korchagin
@ignatkn

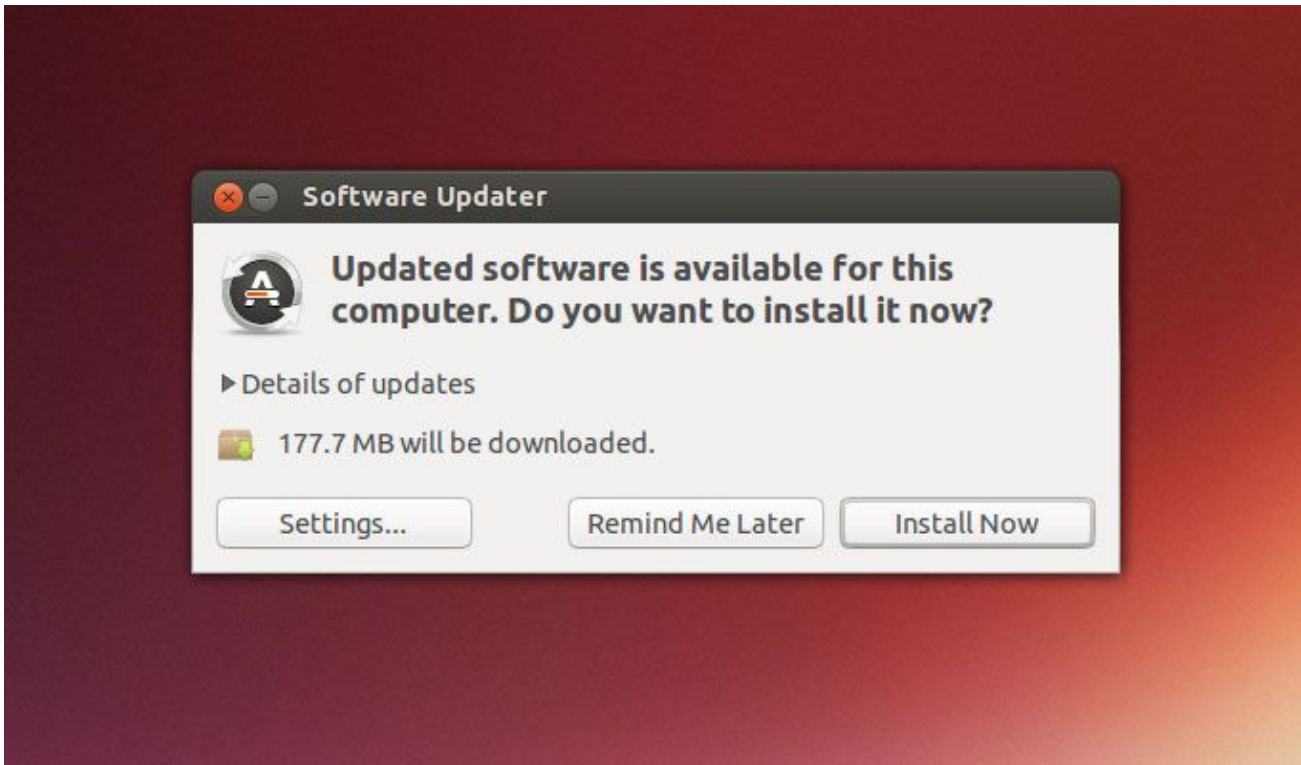

\$ whoami

- Linux team at Cloudflare
- Systems security and performance
- Low-level programming

What do you do in
this case?

Updates available!

Updates available for production systems!

How do we perceive
software updates?

Software updates perception

Regular software upgrades

Common risks of not applying software updates

And Linux Kernel in particular

Bugs are not getting fixed

Bugs are not getting fixed

Commits per release for 6.1.x branch

Bugs are not getting fixed

Commits per release for 6.1.x branch

Out of 76 releases:

- 50 with \geq **100 commits**
- 20 with \geq **200 commits**
- 5 with \geq **500 commits**

Missing out on performance improvements

Missing out on performance improvements

Linux 5.4 to 5.10 migration

Missing out on performance improvements

Linux 5.4 to 5.10 migration

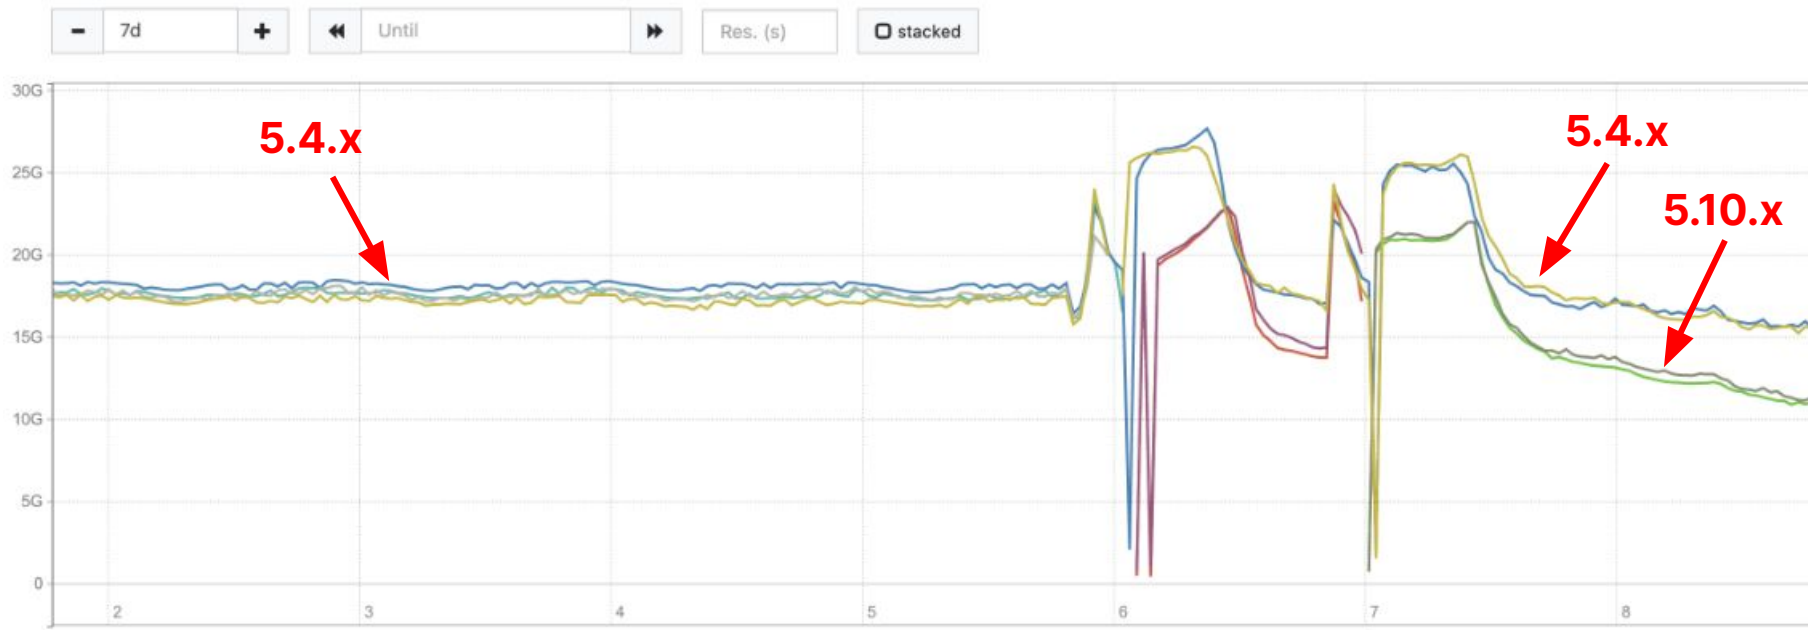

Missing out on performance improvements

Linux 5.4 to 5.10 migration: **saved ~4.5 GiB of RAM per server**

Missing out on performance improvements

Linux 5.4 to 5.10 migration: **saved ~4.5 GiB of RAM per server**

Accumulating change delta

Total commits per release for 6.1.x branch

Accumulating change delta

Change delta (risk):

- 6.1.10 vs 6.1.20: 1762

Total commits per release for 6.1.x branch

Accumulating change delta

Change delta (risk):

- 6.1.10 vs 6.1.20: 1762
- 6.1.10 vs 6.1.30: 3910

Total commits per release for 6.1.x branch

Accumulating change delta

Total commits per release for 6.1.x branch

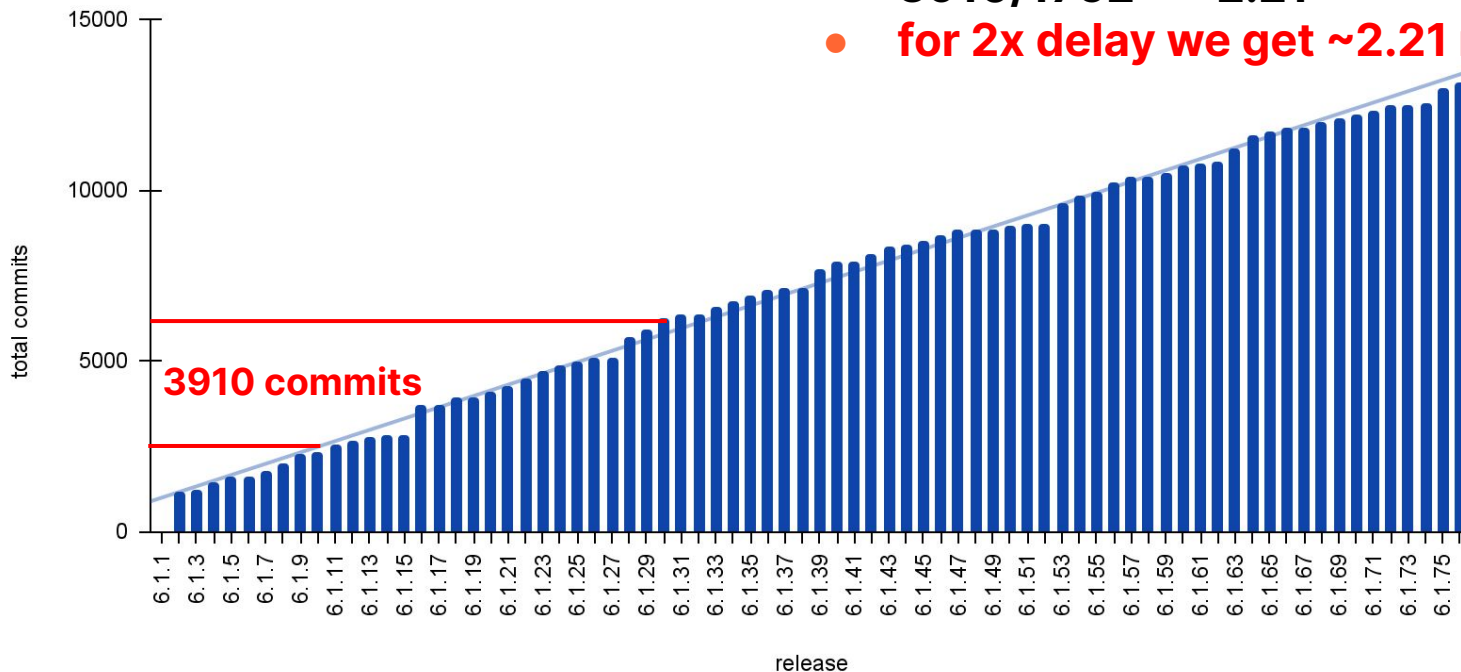

Change delta (risk):

- 6.1.10 vs 6.1.20: 1762
- 6.1.10 vs 6.1.30: 3910
- **3910/1762 = ~2.21**

Accumulating change delta

Total commits per release for 6.1.x branch

Change delta (risk):

- 6.1.10 vs 6.1.20: 1762
- 6.1.10 vs 6.1.30: 3910
- **3910/1762 = ~2.21**
- **for 2x delay we get ~2.21 more risk!**

Security vulnerabilities are not getting fixed

Security vulnerabilities are not getting fixed

CVEs fixed per release for 6.1.x branch

source: <https://www.linuxkernelcves.com>

Security vulnerabilities are not getting fixed

CVEs fixed per release for 6.1.x branch

Out of 71 releases:

- 56 with ≥ 1 CVE patched
- 18 with ≥ 5 CVEs patched

source: <https://www.linuxkernelcves.com>

Compliance risks

Compliance risks

PCI DSS v4.0

6.3.3 All system components are protected from known vulnerabilities by installing applicable security patches/updates as follows:

- Critical or high-security patches/updates (identified according to the risk ranking process at Requirement 6.3.1) are installed within **one month of release**.
- All other applicable security patches/updates are installed within an appropriate time frame as determined by the entity (for example, within three months of release).

Compliance risks

Remember?

(Not so)fun fact:
if your uptime \geq 30 days,
you're system is likely
vulnerable!

Common anti patterns for Linux Kernel releases

Let's justify the upgrade

Which things from the
changelog are
applicable to us?

Let's justify the upgrade

Commits per release for 6.1.x branch

Out of 76 releases:

- 50 with \geq **100** commits
- 20 with \geq **200** commits
- 5 with \geq **500** commits

Let's justify the upgrade

Let's justify the upgrade

Is this security
vulnerability actually
exploitable on our
systems?

Is this vulnerability applicable to us?

The attacker

- Highly motivated to break into the system
- Spends exclusively almost 24/7 to design and implement a successful exploit

Is this vulnerability applicable to us?

The attacker

- Highly motivated to break into the system
- Spends exclusively almost 24/7 to design and implement a successful exploit

Is this vulnerability applicable to us?

The attacker

- Highly motivated to break into the system
- Spends exclusively almost 24/7 to design and implement a successful exploit

Security patch reviewer

- Highly motivated to go home on time
- Needs to review several patches a day
- Has other competing priorities

Is this vulnerability applicable to us?

The attacker

- Highly motivated to break into the system
- Spends exclusively almost 24/7 to design and implement a successful exploit

Security patch reviewer

- Highly motivated to go home on time
- Needs to review several patches a day
- Has other competing priorities

Let it soak

Let's soak it for 1 month in canary to ensure it is stable

Let it soak

Total commits per release for 6.1.x branch

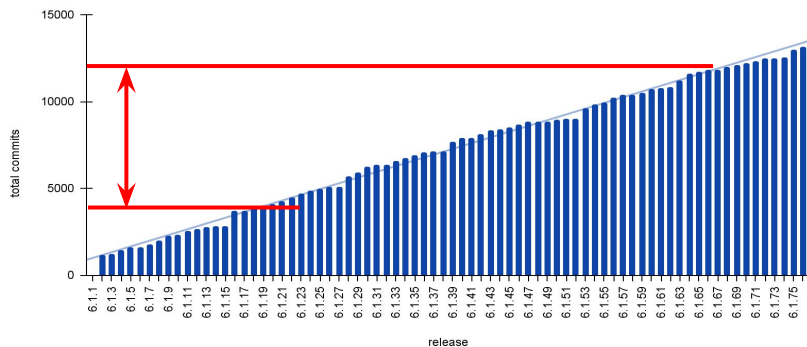

Change delta (risk):

- 6.1.10 vs 6.1.20: 1762
- 6.1.10 vs 6.1.30: 3910
- **3910/1762 = ~2.21**
- **for 2x delay we get ~2.21 more risk!**

Let it soak

Total commits per release for 6.1.x branch

Change delta (risk):

- 6.1.10 vs 6.1.20: 1762
- 6.1.10 vs 6.1.30: 3910
- **3910/1762 = ~2.21**
- **for 2x delay we get ~2.21 more risk!**

CVEs fixed per release for 6.1.x branch

Out of 71 releases:

- 56 with **>= 1 CVE patched**
- 18 with **>= 5 CVEs patched**

Let it soak

Total commits per release for 6.1.x branch

CVEs fixed per release for 6.1.x branch

Change delta (risk):

- 6.1.10 vs 6.1.20: 1762
- 6.1.10 vs 6.1.30: 3910
- **3910/1762 = ~2.21**
- **for 2x delay we get ~2.21 more risk!**

Out of 71 releases:

- 56 with **>= 1 CVE patched**
- 18 with **>= 5 CVEs patched**

Let it soak

High “soak” times probably means

- We don't know what we are looking for
 - Lack of metrics/observability

Let it soak

High “soak” times probably means

- We don't know what we are looking for
 - Lack of metrics/observability
- We don't know our workload
 - What kernel features/subsystems are important to us

Let it soak

High “soak” times probably means

- We don't know what we are looking for
 - Lack of metrics/observability
- We don't know our workload
 - What kernel features/subsystems are important to us
- Lack of sufficient pre-production kernel testing
 - Unit tests
 - Integration tests
 - Performance tests

Too risky!

The Kernel is too critical! Let's
have more approvals before the
deploy!

Too risky!

The Kernel is too critical! Let's have more approvals before the deploy!

Too risky!

Automated software deploys

Automated software deploys

Regular software

- Upgrade software package

Automated software deploys

Regular software

- Upgrade software package
- Service restart
 - graceful/non-graceful

Automated software deploys

Regular software

- Upgrade software package
- Service restart
 - graceful/non-graceful
- **New (bad or good) code can propagate to production in minutes without appropriate safeguards**

Kernel release flow

Kernel release flow

Kernel release flow

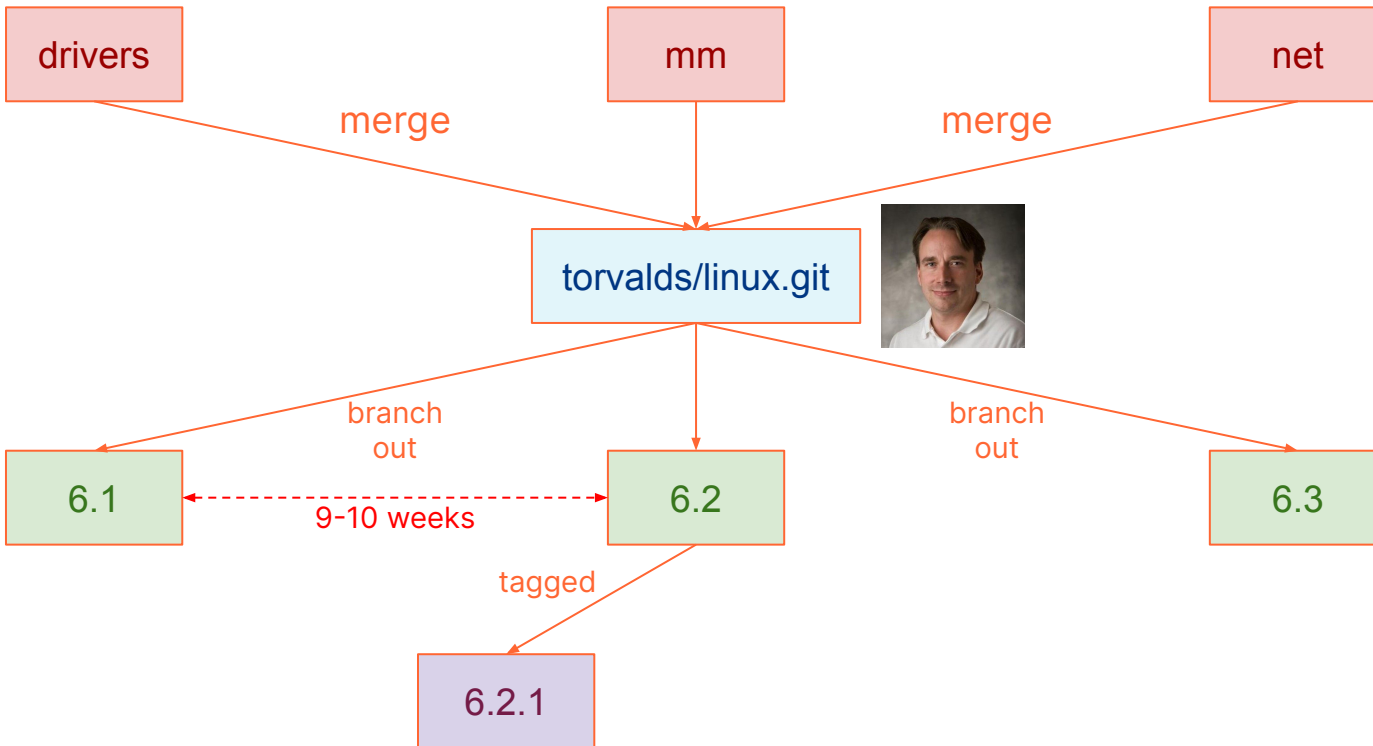

Kernel release flow

Kernel release flow

Linux Kernel releases

- A new major (stable) kernel version is released every 9-10 weeks
 - 2 weeks for development/7 weeks for bugfixing

Linux Kernel releases

- A new major (stable) kernel version is released every 9-10 weeks
 - 2 weeks for development/7 weeks for bugfixing
- Leftmost version number **means nothing**
 - 4.19.x → 4.20.x upgrade can contain more features/breaking changes than 4.20.x → 5.0.x

Linux Kernel releases

- A new major (stable) kernel version is released every 9-10 weeks
 - 2 weeks for development/7 weeks for bugfixing
- Leftmost version number **means nothing**
 - 4.19.x → 4.20.x upgrade can contain more features/breaking changes than 4.20.x → 5.0.x
- Bugfix/patch releases are released around once a week
 - Denoted by rightmost version number
 - Usually cherry-picked from the main Linux branch
 - No new features, therefore regressions are quite rare
 - May contain critical security patches
 - You **almost always** want to apply them

Longterm releases

- Usually a stable release branch is active around 2-3 months
 - After that it is EOL and no bugfixes are backported (including critical security vulnerabilities)
 - A new major stable version should be available at this point

Longterm releases

- Usually a stable release branch is active around 2-3 months
 - After that it is EOL and no bugfixes are backported (including critical security vulnerabilities)
 - A new major stable version should be available at this point
- But there are “longterm” stable releases
 - Bug and security fixes are backported for at least 2 years
 - Usually the last stable release of the year
 - Therefore, released once a year
 - Provides enough time for more rigid evaluation of the next “longterm” release

Longterm releases

- Usually a stable release branch is active around 2-3 months
 - After that it is EOL and no bugfixes are backported (including critical security vulnerabilities)
 - A new major stable version should be available at this point
- But there are “longterm” stable releases
 - Bug and security fixes are backported for at least 2 years
 - Usually the last stable release of the year
 - Therefore, released once a year
 - Provides enough time for more rigid evaluation of the next “longterm” release

Safe and easy production kernel upgrades

Safe and easy production kernel upgrades

**Don't create a dedicated deploy
process for the Linux Kernel**

Safe and easy production kernel upgrades

Don't create a dedicated deploy process for the Linux Kernel

- Kernel upgrades are usually less risky than other software
- A simple staged rollout is usually enough
- Kernel upgrades are naturally slow paced, because they require a reboot
 - A lot of headroom to abort the deploy if things look wrong

Safe and easy production kernel upgrades

**Avoid justifying a bugfix kernel
upgrades**

Safe and easy production kernel upgrades

Avoid justifying a bugfix kernel upgrades

- Should be released with “no questions asked”
- Contain only bug fixes and security patches
 - And most likely some are always applicable
- Regressions are quite uncommon
- Minimise canary “soak” times
 - Use metrics-driven approach instead

Safe and easy production kernel upgrades

Stay on the “longterm” branch, if validating a major version is costly

Safe and easy production kernel upgrades

Stay on the “longterm” branch, if validating a major version is costly

- At least two years of bugfixes and security patches
- But start evaluating the next “longterm” release early in ~1 year
 - More features
 - Better performance and resource utilisation
- Accumulating less change delta

Safe and easy production kernel upgrades

Implement/improve pre-production testing for major version validation

Safe and easy production kernel upgrades

Implement/improve pre-production testing for major version validation

- Understand your workload
- Write tests, which exercise various kernel subsystems required by your workload
 - Can help when communicating issues to the kernel community
- Make metrics-driven decisions
 - Not time-based decisions (minise “soak” times)

Safe and easy production kernel upgrades

Metrics, monitoring and deploy automation
can help with human risk perception

Safe and easy production kernel upgrades

Metrics, monitoring and deploy automation can help with human risk perception

- Data-driven decision if the deploy looks good
- Provides quick early signals about regressions
- Can save the engineering team a debugging cycle
- Automation encourages regular upgrades
 - Removes the need for an operator to perform a “potentially risky” release

Conclusions

- Linux Kernel upgrades are not more risky than any other software
- You need to patch early and patch often
- Bugfix kernel releases should be applied with “no questions asked”
- Understanding your workload, metrics, monitoring and automation allow your systems to stay patched and secure

@ignatkn

Thank you!
